GO WITH THE VEIN FLOW

AND INJECT TOWARD THE HEART

Always inject into a vein and never on an artery. Veins are close to the surface and run in the same direction as the touch. Arteries are located deeper within the body and not as visible. If you hit an artery, it will hurt and your blood will pressure to the wound and prevent the wound from closing. The likelihood about not stop.

Arms usually have three accessible veins. For beginners, try using a soft tie or tourniquet. Use a thin line so that you can easily pull the tie off after injecting. Use a rubber band or a paper respirator bag, but before you push in your hit.

If you are afraid you will miss, you can hit with your thumb. You release the thumb and you feel the hit in slow. Ask your SSP for more information and other supplies.

BEVEL DOWN

THE BEVELS THE SLANTED EDGE AT THE POINT OF THE SYRINGE

The only time the bevel should face down is when drawing up from a cooker. 100% cotton filters are best.

BEVEL UP

The bevel becomes dull after using a 1/2 inch.

Prevents the mixture with the bevel facing up so the sharp tip can pierce the skin first, making the way for the rest of the needle.

GLASS STRAIGHT STEM

CRACK, ROCK COCAINE

Bress screens are best. Ask for them at your SSP.

If you are using a scrubber for a screen, compare the scrubber to the screen which can break apart and burn your mouth and throat when it gets hot.

Pre-burn your scrubber to release toxic fumes.

If sharing a pipe, use your own cover or rubber band.

GLASS BUBBLE PIPE

METH, FENTANYL

Hold the stem end outside first. Holding in your hit won't get you higher but it will damage your lungs.

Heat the pipe from underneath and keep the flame moving around the bowl so you don't burn the bowl. Use a lighter flame. This helps prevent the pipe from cracking and wastes less drug.

CHASING WITH FOIL

ROCK/CRACK WITH METH

Prepare a foil rectangle that is about 6" x 5" (the length and width of your hand). If the foil has a shiny, plastic coating, use a lighter to burn off the shiny side over a flame.

With the dull side facing down, place drugs on the foil and heat from underneath. The lighter a few inches below the foil.

Once the substance has liquefied, keep it moving by tilting your foil.

Use a glass stem or a straw made of foil to chase the smoke.

Take it slow, especially if it's your first time. If you haven't smoked in a while, remember that it's still possible to overdose when smoking, so give yourself a few minutes to see how you feel after that first hit.

BODY BUMPING

Mix drugs with 1-2 ml of clean water. Completely heating in a cooker can help. (It's only a few drops of liquid.)

Later applications are more effective because they are designed to deliver fluid to the rectal cavity. It also holds more liquid than a syringe.

WATER DRIPPING

Water dripping is more effective than sniffing liquid helps.

Water from best to worst: saline, sterile, distilled, bottle or tap.

For a weaker solution, add more water.

Prep rapid amount—storing mixtures can grow bacteria or mold. This is extremely dangerous.

Use a clean syringe (dispose of it safely) or use a dropper.

P.S. This only works for drugs that dissolve in water. Fentanyl, heroin, meth, and powder coke. Water dripping does not work for crack or pills.

IF DRUGS ARE IN YOUR ORBIT, YOU NEED TO KNOW ABOUT FENTANYL, FENTANYL & NALOXONE

If you use fentanyl, you should know about your tolerance. If you use fentanyl, you should know about your tolerance.

Something with glass or foil is up and snorting. If you use fentanyl, you should know about your tolerance.

The drug supply is increasing. If you use fentanyl, you should know about your tolerance.

Water dripping and water dripping are more effective because they are designed to deliver fluid to the rectal cavity.

NALOXONE comes in a small vial, most with an attached air syringe. (25g, 50g, 100g). To avoid drawing up air, tip vial upside down.

NARCAN comes in a small vial. It is stronger than naloxone but comes in a small vial. It is stronger than naloxone but comes in a small vial.

There is no such thing as a "safe" overdose. Naloxone/narcan is used to reverse an opioid overdose. It will not reverse all benzodiazepine, stimulant, and barbiturate overdoses.
